Logo

To start modifying this template, navigate to Logo composition. Drag and drop your logo or type your text there and change its size to fit this composition. If you're using multiple text layers like in the example below, don't hesitate to move them around. Positioning layers differently will make an impact on horizontal and vertical lines in your final animation. So, if you don't like how those lines are appearing later, just go back to this same composition and make some adjustments to your text layers.

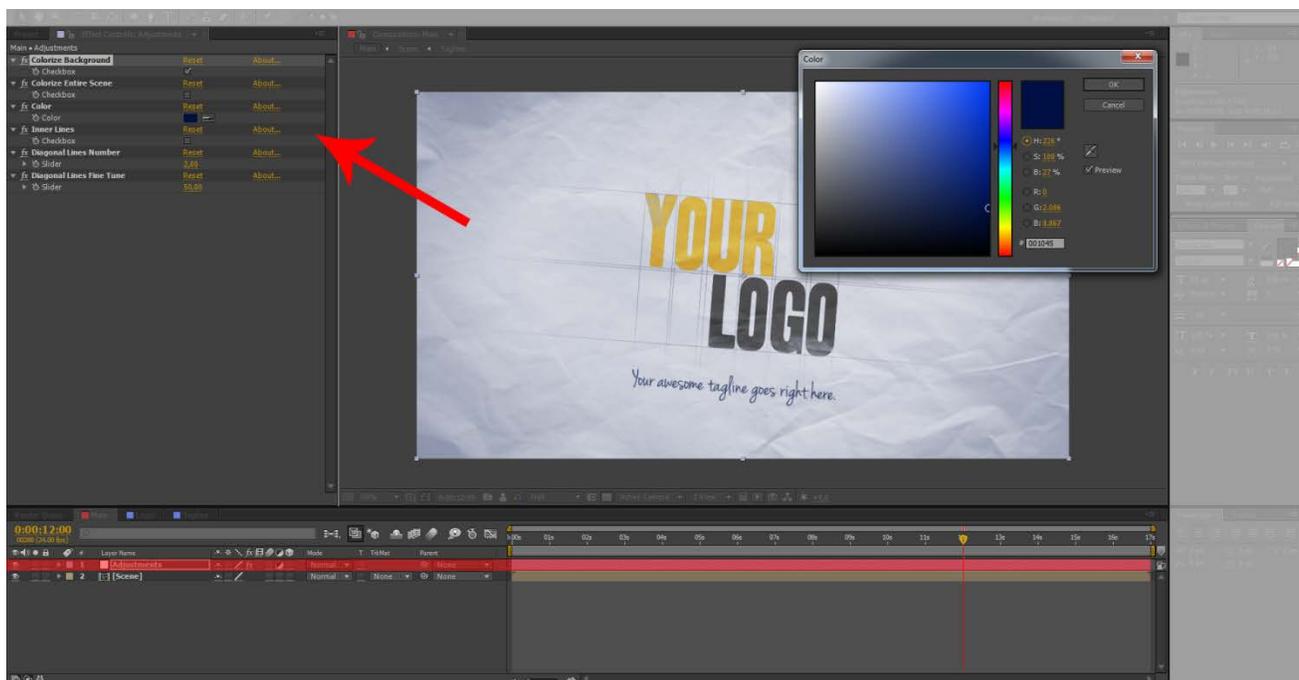

Tagline

To change it, jump into *Tagline* composition and simply write there some catchy line or your website address.

Adjustments

Now go back to the *Main* composition, select the *Adjustments* layer and in the *Effect Controls* window start changing controls to make final adjustments. You can modify background along with your logo to give them more “Ink” color or any other from the color palette and even customize diagonal lines a bit. See the result.

Finally, send this project to render queue and enjoy!
